We demonstrate that this model achieves good estimation performance, and it is able to capture the benefits of energy saving when dealing with the complexity of multi-carrier base stations architectures.

The present invention relates to the field of network communication technology, and in particular to a base station computing power arrangement method, device, electronic equipment and...

In this paper we derive a power model for typical base stations as deployed today. These provide a relative small dynamic contribution to power consumption and the optimum cell size is strongly a ...

What is a preferred power supply architecture for DSL applications? A preferred power supply architecture for DSL applications is illustrated in Fig. 2. A push-pull converter is used to convert the ...

Based on the cell reference power, the power for the NR (New Radio) cell channel can be calculated using an offset, below is an example of SSB ...

Power consumption models for base stations are briefly discussed as part of the development of a model for life cycle assessment. An overview of relevant base station power ...

In this article, a mathematical model of the power supply system for a mobile communication base station is developed. Based on the developed mathematical model, the mobile communication base ...

We provide a parameterized linear power model which covers the individual aspects of a BS which are relevant for a power consumption analysis, especially the transmission bandwidth and ...

To understand this, we need to look closer at the base station power consumption characteristics (Figure 3). The model shows that there is significant energy consumption in the base ...

Base station power module calculation method
