Light from the sun is converted to electricity via lunar solar cells installed on the lunar equator. The electricity is transmitted to the earth-oriented side of the moon via a power cable. It is then converted ...

On the Moon, the lunar power plant would transmit solar power to the energy-converting facilities. From there, the converted power would be beamed to power-collecting stations on Earth with lasers ...

Known as the Luna Ring, this concept envisions creating a 250-mile-wide ring of solar panels around the Moon's equator to capture solar energy and beam it back to Earth using ...

NASA's Gateway is coming to life with a solar-powered spacecraft built to light it up--and move it around the Moon.

This extended model, laying the foundations for manned landings on Mars, should be completed by 2050. It "will be powered by solar, radioisotope ...

At the heart of Blue Alchemist is a wild, yet surprisingly practical idea: turn lunar regolith (Moon soil) into vital supplies. That includes producing oxygen -- crucial for breathing and rocket...

NASA is one step closer to understanding the solar power challenges and opportunities on the Moon's surface after completing the build ...

The system we intend to build on the moon, dubbed LunaGrid, will consist of a network of solar-power generating stations, or nodes, connected by ...

Making solar panels on the Moon could be the solution to reliably providing energy to lunar settlements. Scientists have found a way of making ...
