-----

By imitating the microscopic structure of a butterfly wing, a group of researchers designed a more efficient solar cell.

Our lightweight solar panels weigh only 4,3 kg per square meter, compared to 16 kg if they were conventional panels made with glass. This is a groundbreaking ...

This butterfly's wings aren't blue because of pigment... they bend light with microscopic structures! ? Scientists are copying this design to make solar panels more efficient and even create...

Discover how the wings of the black butterfly have inspired a revolutionary technology to improve the efficiency of solar panels by 200%.

In the hunt for sustainable energy, solar power has emerged as a front runner for supplying part of the world's energy needs. And Will Tingle has been finding out how three species of ...

Researchers mimicked these structures and placed them silicon-based solar panels, to help reduce light reflection. If less light is reflected, that means more ...

Australian engineers created nanostructures inspired by butterfly wings that can direct sunlight with unprecedented precision, enhancing solar cell efficiency by capturing the entire solar ...

Some butterflies have evolved wings that manipulate not just visible light, but also ultraviolet and near-infrared radiation. This broad-spectrum capability is exactly what solar panel ...

Scientists from KIT and Caltech utilize the disordered nanoholes of the black butterfly to improve solar cell performance. The wings of a butterfly ...
