-----

In general, it is found that the most effective design of vortex generators for the upper surface of an airfoil calls for a single row of flat fins perpendicular to the surface near the leading edge (at about 10% ...

In addition to the blades, design of a complete wind power system must also address the hub, controls, generator, supporting structure and foundation. ...

The design of FL-10 wind tunnel gust generator is reasonable, and the unique design method of hydraulic servo swing cylinder driving blades alone is adopted to reduce the coupling vibration ...

Increased automation in wind blade manufacturing may result in lower direct labor content to produce wind blades while improving reliability, which will help lower costs and increase domestic wind blade ...

This paper details improving a wind turbine blade's aerodynamic, aero-acoustic, and structural properties under different operating conditions, focusing especially on active and passive ...

Generating electricity causes wind energy systems to convert the mechanical energy of the wind turbine blades into electrical power for utilization. ...

This case study exemplifies the potential of segmented blades to address both the physical and economic challenges of scaling up wind turbine ...

Through an exploration of the evolution from traditional materials to cutting-edge composites, the paper highlights how these developments ...

Focusing on optimizing wind turbine aerodynamic efficiency, performance, and manufacturing ease, this work examined a broad range of ...
